Graduation project

You have to create a website which receives log data (from a file), you have to analyse these data and to generate the statistics.

- The log data (from the Apache web server) we ask you to download (/vol/lehre/python/2016/logs)
- The statistics will be generated in SVG format.
- The log will be evaluated by time / date, URL (up to the second '/'), Country (client name, IP address).
- The project will be hosted on the Mini httpd server (described in CGI / HTML).
- Groups of two.

Tips

- The project can be easily divided into several independant sub-tasks for implementation and tests.
- Be carefull with incompatible Python code !
- The SVG module from the last task of the SVG slides can spare a lot of time when the SVG graphics will be created.
